

## Appendix D

### Economic Background

It was agreed at the last meeting of the Bank of England Monetary Policy Committee to keep Bank Rate unchanged at 0.10% and continue the existing programme of UK government bond purchases of £875bn which is due to end by the end of this year.

The MPC noted the developing upside risks in the UK to both activity and inflation and the MPC admitted the Governor may have to write to the Chancellor later this year explaining why inflation is more than 1% above the 2% target.

But the key point is that the MPC still appears willing to ride out the inevitable spike in inflation over the next six months as it thinks it will be short-lived and caused by one-off reopening price rises and supply shortages relative to demand - boosted by consumers having built up huge savings of around £145bn during lockdown. These spikes will drop out of the CPI calculation over the next twelve months. The forward guidance in the policy statement designed to demonstrate the MPC's patience was left intact, and the emphasis remained on the medium-term prospects for inflation rather than factors that are likely to be transient. It also repeated that it will not raise Bank Rate until the 2% inflation target has been attained sustainably i.e. the mere fact that it is forecasting inflation to be over 2% during 2021 and 2022 is not in itself sufficient to justify an increase in Bank Rate in the near future. The MPC indicated that some members would prefer to wait for a clearer picture of the underlying pace of the recovery once the furlough scheme expires at the end of September, before making any judgement on medium-term inflationary pressures. This implies that the MPC may be unlikely to be in a position to consider a change in policy until early in 2022 at the earliest.

In addition, the Bank is undertaking a review of its stated current policy to raise Bank Rate first before unwinding quantitative easing (QE) purchases of gilts. Indeed, it now appears to be likely that the Bank could unwind QE first before raising Bank Rate as it sees QE as a very useful quick acting weapon to use to combat any sudden dysfunction in financial markets, as happened in March 2020. However, it is currently nearly maxed out on the total level of QE. Unwinding QE first would cause short term gilt yields to remain anchored at low levels and medium and long term gilt yields to steepen. Money markets are currently expecting Bank Rate to start rising in mid-2022 but they are probably being too heavily influenced by looking across the Atlantic where inflationary pressures are much stronger than in the UK and building up further under a major boost from huge Federal government stimulus packages. Overall, there could be only a minimal increase in Bank Rate in 2023 or possibly no

increases before 2024.

The Bank of England revised up its expectations for the level of UK GDP in 2021 by around 1.5% since the May Report due to the easing of restrictions on economic activity; this now leaves total GDP in June only around 2.5% below its pre-Covid 2019 level. UK GDP grew by 1.5% in the three months to April 2021: this was the first expansion since the three months to December 2020. Forward looking monthly business surveys are running at exceptionally high levels indicating that we are heading into a strong economic recovery. Capital Economics do not think that the UK economy will suffer major scarring from the lockdowns. The one month delay to the final easing of restrictions in July is unlikely to have much effect on the progress of recovery with GDP getting back to pre-Covid levels during August.

COVID-19 vaccines have been the game changer which have enormously boosted confidence that life in the UK could largely return to normal during the second half of 2021 after a third wave of the virus threatened to overwhelm hospitals in Q1 this year. With the household saving rate having been exceptionally high since the first lockdown in March 2020, there is plenty of demand and purchasing power stored up for services in hard hit sectors like restaurants, travel and hotels. The UK has made fast progress, giving both jobs to nearly half of the total population and one job to two thirds, (84% of all adults). This programme should be completed in the second half of the year. The big question is whether mutations of the virus could develop which render current vaccines ineffective, as opposed to how quickly vaccines can be modified to deal with them and enhanced testing programmes be implemented to contain their spread.

In the US, the Democrats won the presidential election in November 2020 and have control of both Congress and the Senate, although power is more limited in the latter. This enabled the Democrats to pass a \$1.9trn (8.8% of GDP) stimulus package in March on top of the \$900bn fiscal stimulus deal passed by Congress in late December. These, together with the vaccine rollout proceeding swiftly to hit the target of giving a first job to over half of the population within the President's first 100 days, will promote a rapid easing of restrictions and strong economic recovery during 2021. The Democrats are also now negotiating to pass a \$1trn fiscal stimulus package aimed at renewing infrastructure over the next decade. Although this package is longer-term, if passed, it would also help economic recovery in the near-term.

At the Federal Reserve Bank's June meeting, it stuck to its line that it expects strong economic growth this year to have only a transitory impact on inflation which is being temporarily boosted by base effects, spikes in reopening inflation and supply shortages. The big surprise was the extent of the upward shift in the interest rate projections:

having previously expected no hikes until 2024 at the earliest, most officials now anticipate two in 2023, with 7 out of 18 expecting to raise rates next year. This was a first indication that there was rising concern about the risks around inflationary pressures building up on a more ongoing basis and is somewhat hard to reconcile to the words around inflation pressures being only transitory.

In the Eurozone, both the roll out and take up of vaccines was disappointingly slow in the EU in the first few months of 2021 but has since been rapidly catching up. This delay will inevitably put back economic recovery after the economy had staged a rapid rebound from the first lockdowns in Q3 of 2020 but contracted slightly in Q4 to end 2020 only 4.9% below its pre-pandemic level. After contracting by another 0.3% in Q1 of 2021, recovery will now be delayed until Q3 of 2021. At its June meeting, the ECB forecast strong economic recovery with growth of 4.6% and 4.7% in 2021 and 2022 respectively.

In China, after a concerted effort to get on top of the virus outbreak in Q1 of 2020, economic recovery was strong in the rest of 2020; this enabled China to recover all the contraction in Q1 2021. Policy makers have both quashed the virus and implemented a programme of monetary and fiscal support that has been particularly effective at stimulating short-term growth. After making a rapid recovery in 2020/21, growth is likely to be tepid in 2021/22.

The coronavirus outbreak has done huge economic damage to the UK and to economies around the world. After the Bank of England took emergency action in March to cut Bank Rate to 0.25%, and then to 0.10%, it left Bank Rate unchanged at its subsequent meetings, although some forecasters had suggested that a cut into negative territory could have happened prior to more recent months when strong recovery started kicking in. However, the minutes of the Monetary Policy Committee in February 2021 made it clear that commercial banks could not implement negative rates within six months; by that time the economy would be expected to be recovering strongly and so there would be no requirement for negative rates. As shown in the forecast table below, one tentative increase in Bank Rate from 0.10% to 0.25% has now been forecast for quarter 2 of 2023/24 as an indication that the Bank of England will be moving towards some form of monetary tightening around this time. However, it could well opt for reducing its stock of quantitative easing purchases of gilts as a first measure to use before increasing Bank Rate so it is quite possible that we will not see any increase in Bank Rate in the three-year forecast period shown.

## **Borrowing**

It is a statutory duty for the Council to determine and keep under

review the “Affordable Borrowing Limits”. The Council’s approved Treasury and Prudential Indicators (affordability limits) are included in the approved Treasury Management Strategy. A list of the approved limits is shown in Appendix B. The Prudential Indicators were not breached during the first quarter of 2021/22 and have not been previously breached. The schedule at Appendix C details the Prudential Borrowing approved and utilised to date.

In November 2020, the Chancellor announced the conclusion to the review of PWLB rates and subsequently all borrowing rates were reduced by 1%; but a prohibition was introduced to deny access to borrowing from the PWLB for any local authority which had purchase of assets for yield in its three year capital programme. Link’s target rate for new long-term borrowing (50 years) for the first quarter of 2021/22 was increased to 1.94%. No new external borrowing has been undertaken to date in 2021/22. The low and high points during the quarter can be seen in the table below.

	1 Year	5 Year	10 Year	25 Year	50 Year
<b>Low</b>	0.78%	1.12%	1.60%	2.03%	1.83%
